

Account-based digital asset ledger and trade system.

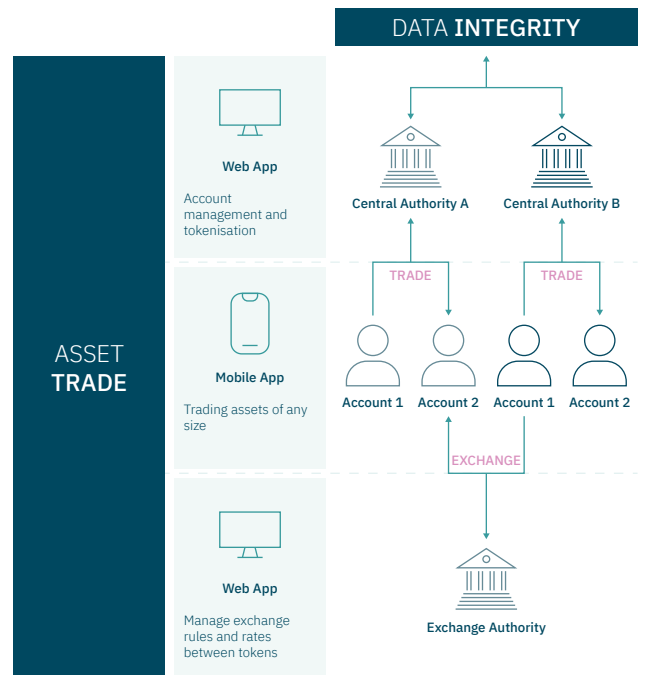

OVERVIEW

A product to tokenise and trade assets between people, businesses and machines.

Tokens represent anything that has value, including currency, coins or other digital assets, and even physical commodities like goods, oil, or precious metals, which can be exchanged at set rates.

Issuers manage user accounts, which record the credit and debit of assets and support the ability to trade between different asset types across different economies.

Asset Trade can integrate seamlessly into Know Your Customer identification services as an Anti-Money Laundering initiative.

FEATURES

-  **Pegged physical, digital assets**
